

Python GUI Course for Absolute Beginners (Learn the Fun Way)

This course is designed for students who know nothing about Python and want to start learning in a visual and fun way. Instead of starting with boring theory, we jump straight into making graphical interfaces (GUI) so you can see results immediately. Logic like variables and if-statements will be introduced naturally later.

What You Will Learn Without Realizing It

- 1 How to open windows
- 2 How to show messages
- 3 How to resize GUIs
- 4 How to add buttons
- 5 How buttons react (introduction to logic later)

Step 0 – Setup (One Time Only)

1. Install Python

Download Python 3 from python.org and during installation make sure to check “Add Python to PATH”.

2. Code Editor

Use VS Code or IDLE (comes with Python).

Exercise 1 – Your First GUI (Message Box)

Goal: Click → message appears.

Code:

```
from tkinter import messagebox
messagebox.showinfo('Hello!', 'Welcome to your first Python GUI ■')
```

Explanation: tkinter is Python’s GUI toolbox. `messagebox.showinfo()` pops up a window.

Exercise 2 – Your First Real Window

Code:

```
import tkinter as tk
window = tk.Tk()
window.mainloop()
```

`Tk()` creates the window. `mainloop()` keeps it open. Every GUI needs a `mainloop`.

Exercise 3 – Change Window Size and Title

Code:

```
import tkinter as tk
window = tk.Tk()
window.title('My First App ■')
window.geometry('400x300')
```

```
window.mainloop()
```

You changed the title and the window size (width x height).

Exercise 4 – Add Text (Label)

Code:

```
import tkinter as tk
window = tk.Tk()
window.title('My App')
window.geometry('400x300')
label = tk.Label(window, text='Hello World ■', font=('Arial', 16))
label.pack()
window.mainloop()
```

A Label is text on the screen. pack() places it inside the window.

Exercise 5 – Add Your First Button

Code:

```
import tkinter as tk
window = tk.Tk()
window.title('Button App')
window.geometry('400x300')
button = tk.Button(window, text='Click Me')
button.pack()
window.mainloop()
```

You just created a clickable button.

Exercise 6 – Button That Shows a Message

Code:

```
import tkinter as tk
from tkinter import messagebox

def say_hello():
    messagebox.showinfo('Hi', 'You clicked the button ■')

window = tk.Tk()
window.title('Smart Button')
window.geometry('400x300')
button = tk.Button(window, text='Click Me', command=say_hello)
button.pack()
window.mainloop()
```

command=say_hello means: when the button is clicked, run this function.

Mini Challenges

- 1 Change the button text
- 2 Change the window size

- 3 Add a second button that closes the app

What Comes Next

- 1 Colors and styling
- 2 Variables with counters
- 3 if statements for reactions
- 4 Layouts (grid and place)
- 5 Mini projects: calculator, login screen, simple games
